Configurations

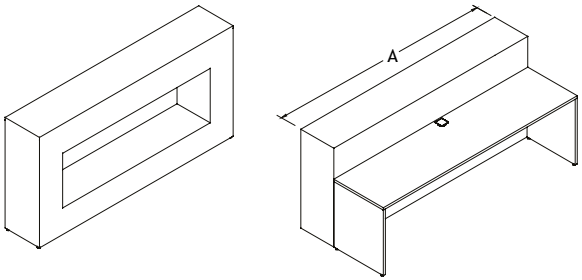
Multiple configurations are possible by combining one of three Monochrom reception counter models with different desks, returns and cabinets. It is important to consider the following in selecting the desk to combine with the reception counter.

MON - Linear Reception Counter:

This counter has been designed to achieve a linear configuration. Both sides of the work desk are visible.

- The width of the desk is the same as the width of the reception desk.
- There are no restrictions on the depth of the desk.

***Note:** For stability purposes it is recommended that this reception counter be attached to a desk.*



MONL/MONR (40" and 46" deep) - "L" Shaped Reception Counter

This counter has been designed to achieve an overall linear configuration. The return of the counter can hide one of the sides of the desk.

- The width of the desk must be 16" less than the width of the counter (Dim. A).
- The depth of the desk must be 16" less than the counter depth (Dim. B)

This counter has been designed to achieve an L-shaped configuration. The return of the counter can hide one side of the desk and return.

- The width of the desk must be 16" less than the width of the counter (Dim. A).
- The width of the return will depend on the depth of the desk.
  - If the desk is 24" deep, the return must be 40" less than the counter depth (Dim. B)
  - If the desk is 30" deep, the return must be 46" less than the counter depth (Dim. B)

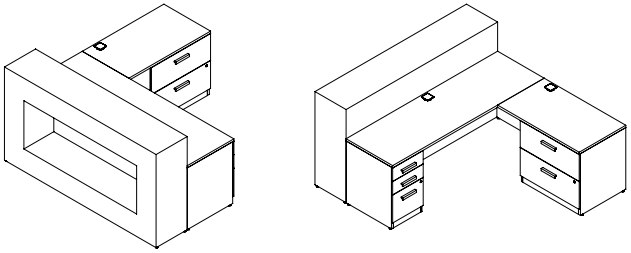
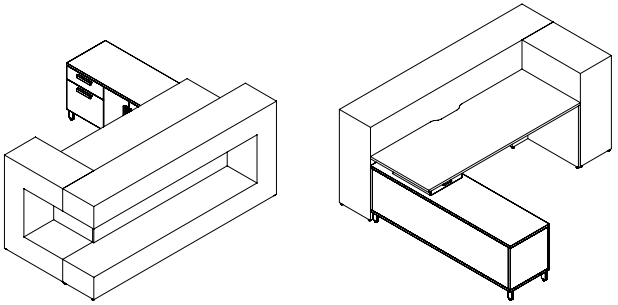
So Many Other Possible Configurations

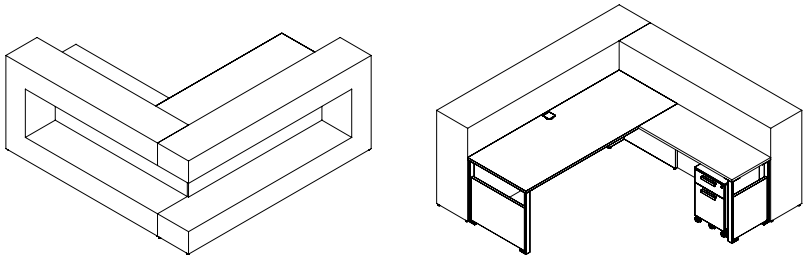
As the reception counter is independent to the desk, you can create different types of configurations. It is therefore important to consider the measurements mentioned on the previous page. Here are only a few ideas of the possibilities... let your imagination go!



Example 1:
MON linear reception counter, Manhattan desk with E pedestal, right return with 2 lateral filing drawers.



Example 2:
MONR "L" shaped reception counter, Level layering desk FM with drawer suppport and wire cutout, UN02SL high pedestal.



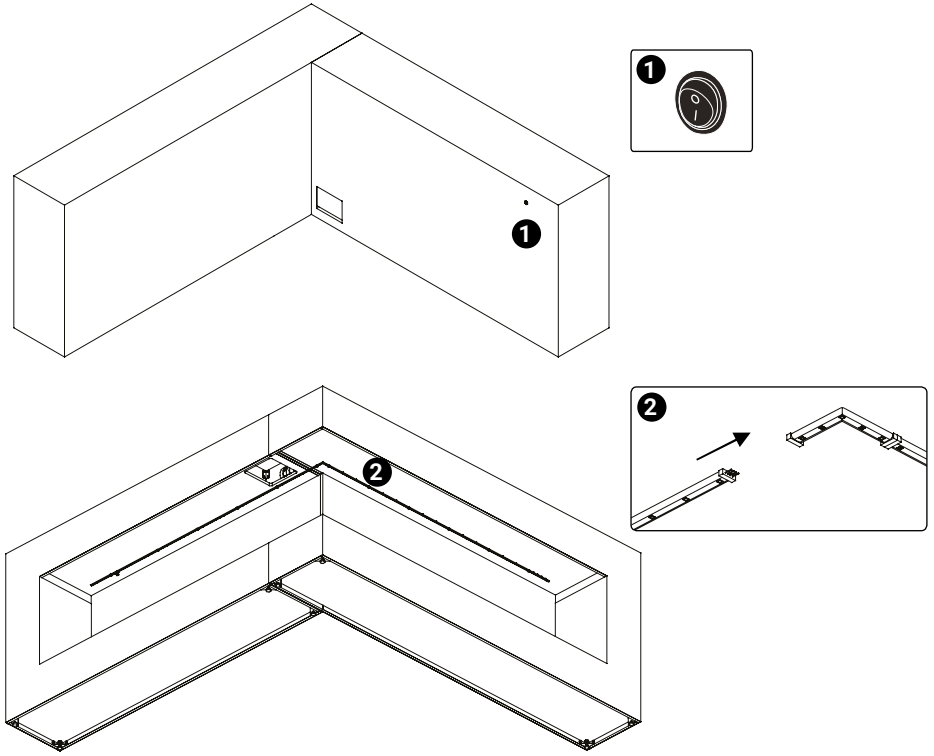
Example 3:
MONR "L" shaped reception counter, Level YM desk, RY return, MOBD mobile pedestal.

LED Option

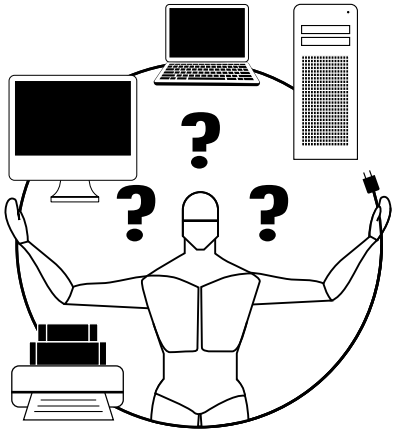
The LED option* consists of an LED strip installed below the counter surface, which illuminates the recessed façade. A black switch ❶ is on the back of the reception (see image opposite).

If the LED option has been ordered, the cabinet comes with LED strips already installed under the countertop. Just connect the strips together ❷ at the junction of the counters during assembly.

***Note:** The LED otion must absolutely be ordered at the same time as the reception desk. Since it requires machining, it can not be added later.



Appendix G: Calculation/Use of Electrical Components



An Introduction to Calculation and Use of Electrical Components

Most people are uncomfortable with anything related to electricity. This step-by-step guide is intended for people who are not familiar with electrical installations but who have to specify what system they need when ordering furniture. In this guide, you will learn how to choose and specify the electrical components required for your projects. The list that follows illustrates and identifies each product and describes its applications.

The electrical components are all recognized by the Underwriters Laboratory (UL) as office furniture accessories and are manufactured according to Canadian Standards Association (CSA) and UL electrical standards.

Note: **All electrical connections must be performed by a certified electrician.**

By following these 3 simple steps, you can easily determine the number of circuits required to ensure safe use of your electrical system.

1. Determing the Number of Amperes Required
2. Calculating the Total Amperes
3. Determing How Many Circuits You Need

STEP 1:
Determing the Number of Amperes Required

What is Amperage
An Ampere (Amp or A) is a unit for measuring the rate at which electric current flows. All electrical equipment has an amperage rate. By following these few simple steps, you can easily determine the number of circuits required to ensure safe use of your electrical equipment.

Determine the Number of Amperes Required
On your computer or other electric devices (ie: monitor, central processing unit, printer) find the plate that provides the technical specifications as follows:

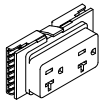
Input: 120V - 1.8A.

If you cannot locate this information on the machine, you will probably find it in the user manual.

Here are a few examples of how many Amps some equipment may consume. Please note that these are examples and the number of amperes may vary from one machine to another.

Electrical System Capacity

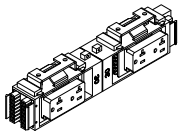
Our electrical system is designed for circuits of 20 amps each. This includes electrical components such as computers, printers, laptops, monitors, server or other devices.



20A

A single Duplex has a maximum capacity of 20 A

Each power block can hold 2 Duplex



Each power block can hold 4 Duplex

= 20A

If the duplexes are connected to the same circuit, the capacity is divided between them. For example, 3 duplexes connected to the same circuit have a total capacity of 20A.

Appendix G: Calculation/Use of Electrical Components

STEP 2:
Calculating the Total Amperes

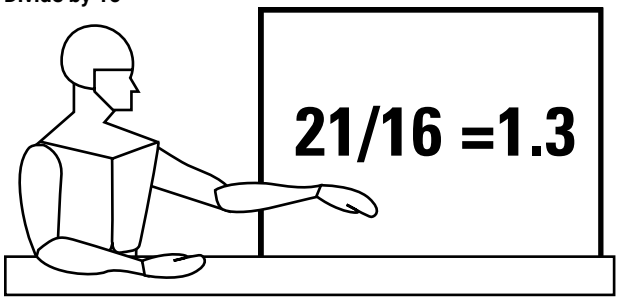
Add the Amperes

Add the number of amps for each machine. In our example, there are 4 CPUs at 2.5A per computer, 4 monitors at 0.5A and one printer at 9A.

2.5A + .5A + 2.5A + .5A + 2.5A + .5A + 2.5A + .5A + 9A = **21A**

The total number of amperes used in this example equals to 21A.

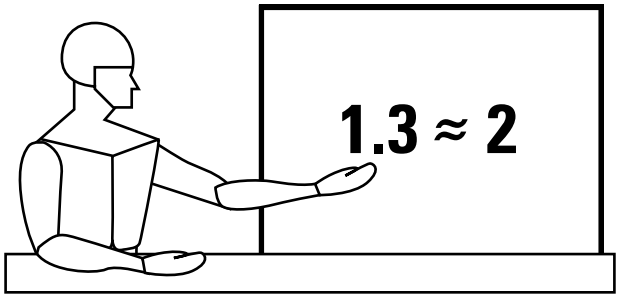
Divide by 16



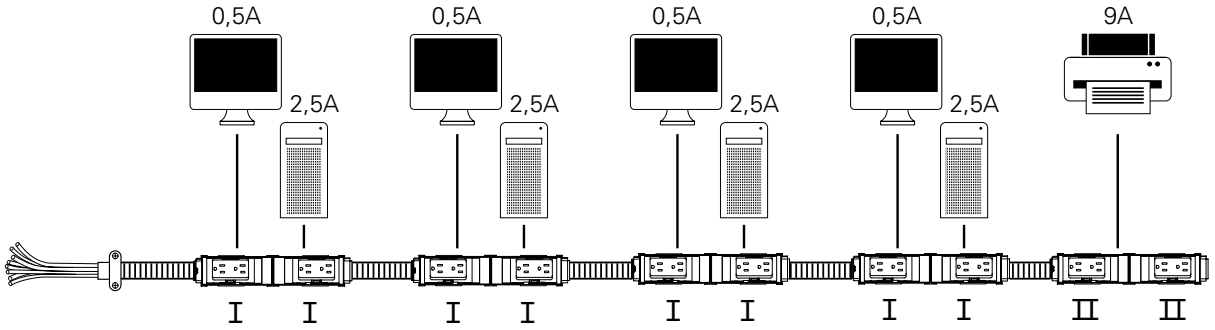
Most machines and computers used in offices or schools are used continuously for many hours at a time. In this type of situation, national electrical codes usually limit circuits at 80% of their capacity of continuous use. Our electrical system is designed for circuits of 20 amps each. So 80% of 20A is 16 Amps You must therefore divide the total number of amperes calculated by 16.

STEP 3:
Determing How Many Circuits You Need

In most cases, this number will contain decimals. Round up to the next whole number, and this will be the number of circuits required for your equipment to run safely. If the number obtained is higher than 4 (the maximum number of circuits for a system), you must reduce the total amperage or add another electrical system. Continuing with our example, the 1.3A is rounded up to 2A.



Here is one possible configuration. Using 5 power blocks joined together with junction cables, only 2 circuits are being used. The 4 workstations would be on the first circuit for a total of 16 amps. The printer would be on the second circuit.



CHICAGO CODE

There is a specific norm about Chicago electrical components. Some of our products are approved, but not all of them.

If you see this logo in Accessories, this means the product is **NOT** approved in Chicago. More info here.
